

## Forklift Fork Positioner

Forklift Fork Positioner - A fork positioner is actually a device constructed out of high quality materials meant to withstand the most difficult procedures and work environments. This piece of equipment could enable drivers to be able to control the forks hydraulically without leaving the seat. Side shifting models have the extra ability to be able to laterally position the arms or the entire load so as to facilitate much more exact carrying and placement in a quicker and more effective manner.

The unique blade pocket design enables operators to securely swing the unit's blades without any worry of destroying the positioning cylinders. This could allow the operator the option to either execute independent or simultaneous fork movement, dependent upon the job requirement. For most forklifts with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages could be converted into fork positioners on available units.
